Maintaining the depth of a marina or canal, whether private or public, is vital to the safety and protecting patron vessels from damage. Regular dredging assures boaters that they can move freely in and out of these passages without fear. Keeping a marina or canal clear can also benefit both business and ecosystems upstream from where the dredging takes place.

Omega Maritime's standard dredge product line includes multiple dredge solutions for these applications. The 300SL Swinging Dragon® dredge and the 460SL Swinging Dragon® dredge are ideal for this application. Both of these dredges do not utilize swing anchors or cables that can become a hazard to boat traffic.
