Omega Maritime Coiled tubing (CT) cleanouts are used to clean debris and/or particulates from boreholes. Water- or oil-based fluids can be used, mixed with nitrogen if required. Most cleanouts are done with a simple BHA consisting of a connector, a double check valve, and a wash nozzle. Wash nozzles are offered in many different configurations, depending on the particular job and preference.

Other options for cleanout tools include:

- mandrel bypass tools when gas lift mandrels are included in the well completion
- packer jumpers when difficulties are encountered in passing through restrictions
- positive displacement motors and bits.
